Conformational proteomics for nanomedicine

				
A model of an alphavirus, which is closely related to West Nile virus; diameter about 70nm.	A hepatitis E virus-like particle is made of protein compounds along the edges of a 20-faced cage	The replication cycle of the polio (or common cold) virus as it releases its genome from its open shell.	A rice reovirus is composed of 780 copies of proteins on top of an inner shell; diameter about 70nm.	A human DNA tumor virus; diameter about 50nm.

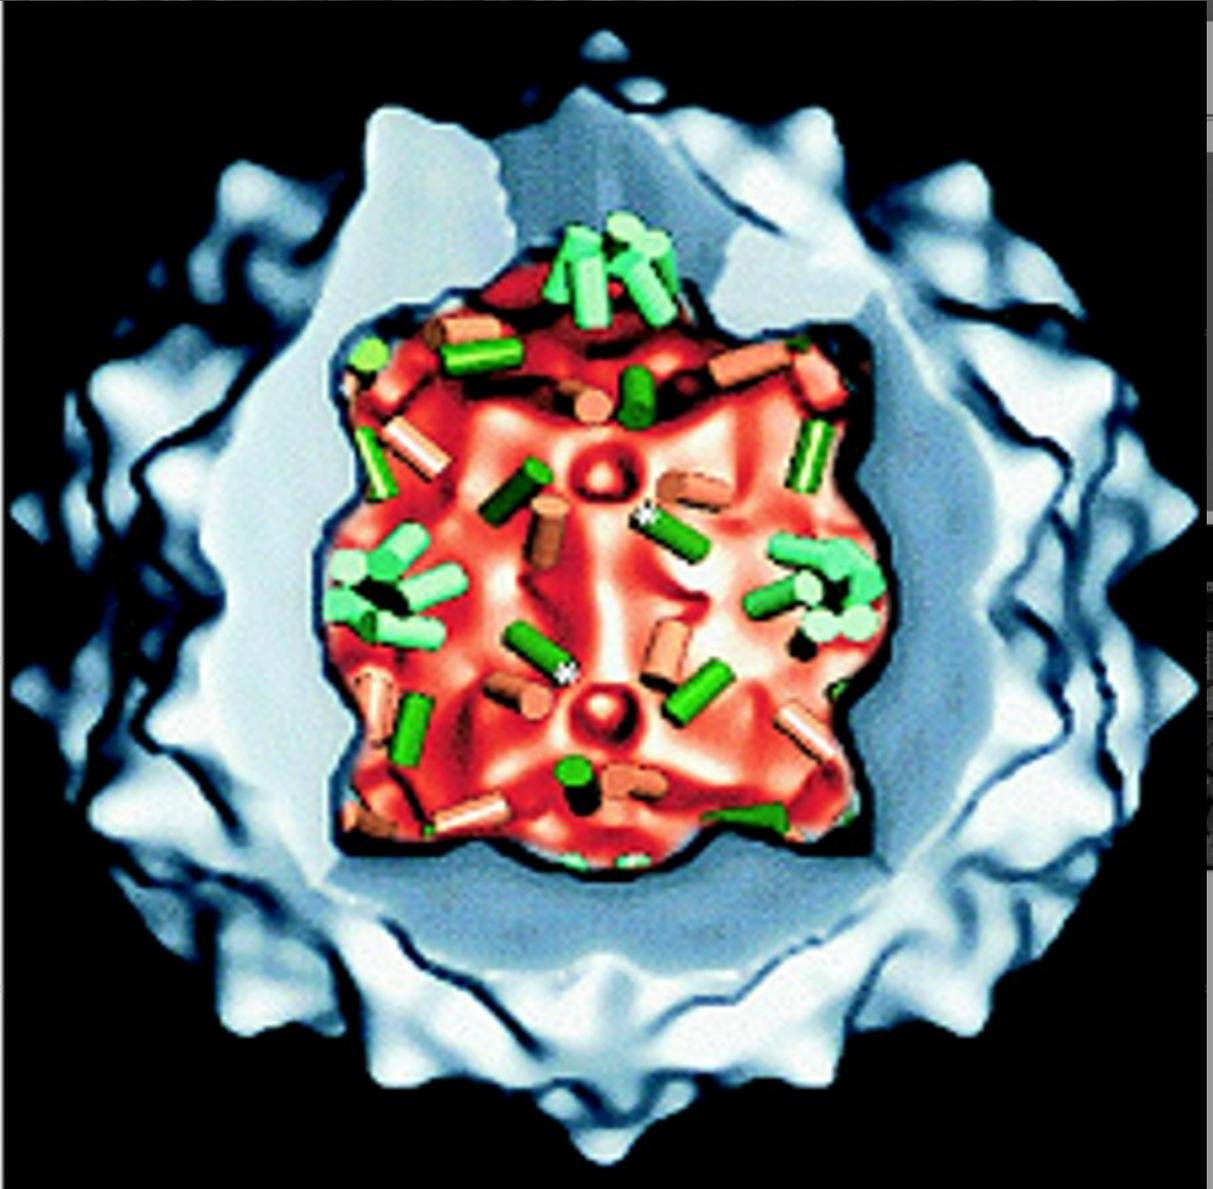

Model approximation / deformation to prevent bias

- knowledge base
- averaged mass
- majority call / population convergence
- familiar object assumption
- geometry common lines
- single molecule reconstruction

Genome In/Out via a 30nm particle

Posterior Expectation Maximization

- No morphological prior!
- Poisson distribution assumed
- Median filter used as regularization

Based on Bayesian inference:

$$p(f|g) = p(g|f)p(f) / p(g)$$

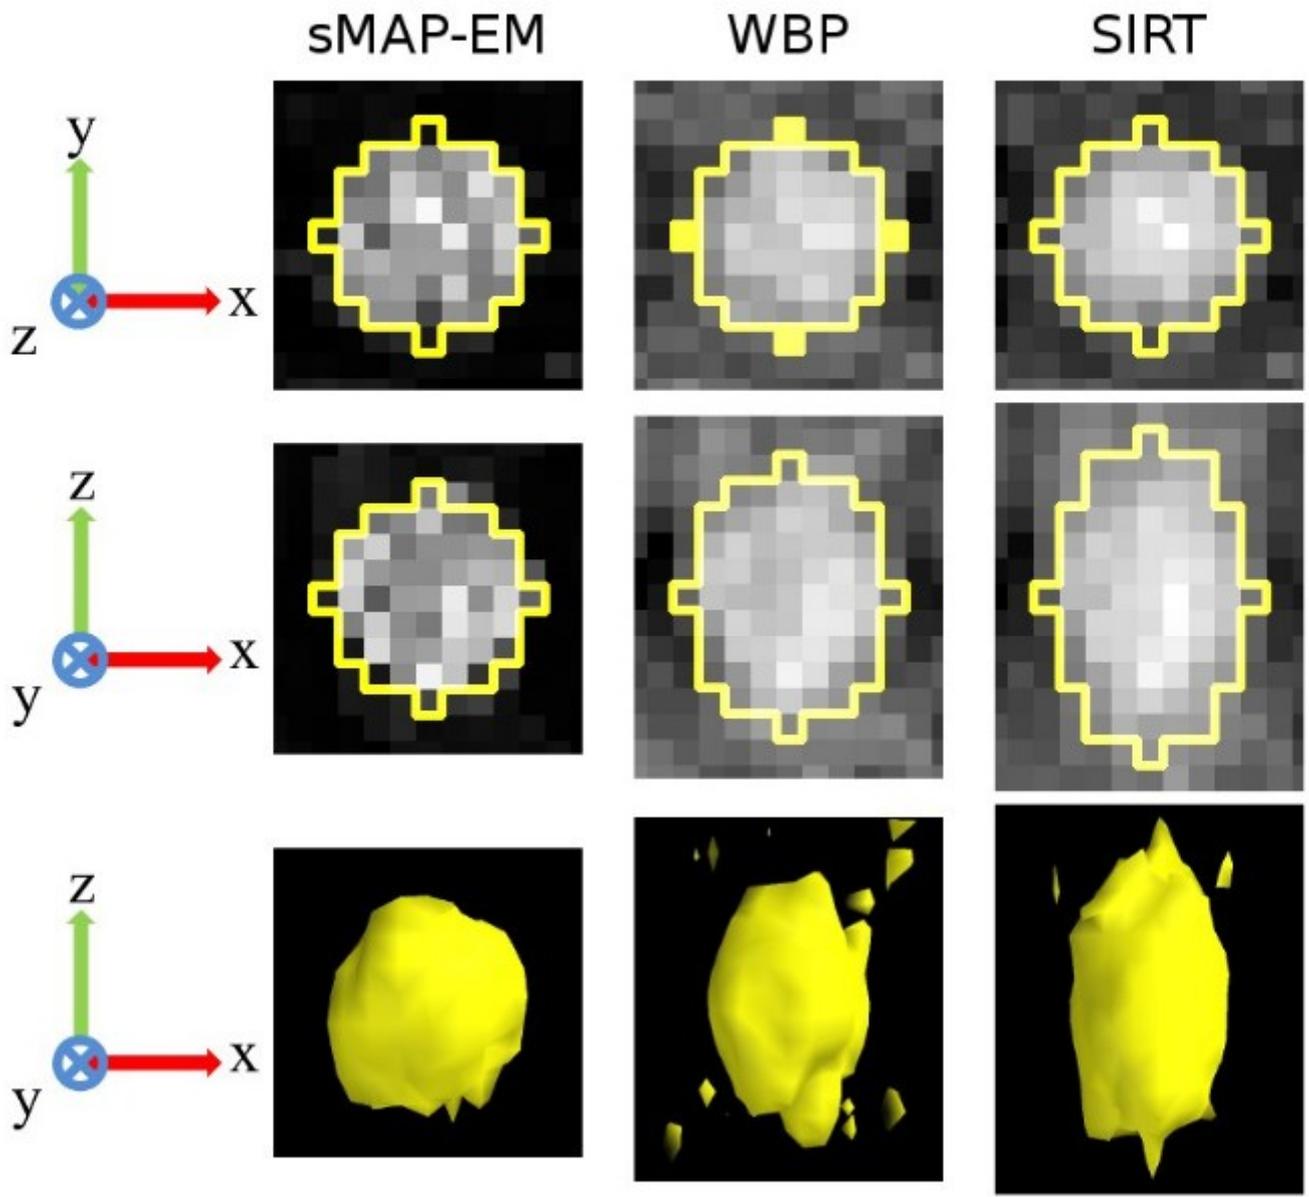

$p(f|g)$ is posterior probability

$p(g|f)$ is likelihood (image acquisition)

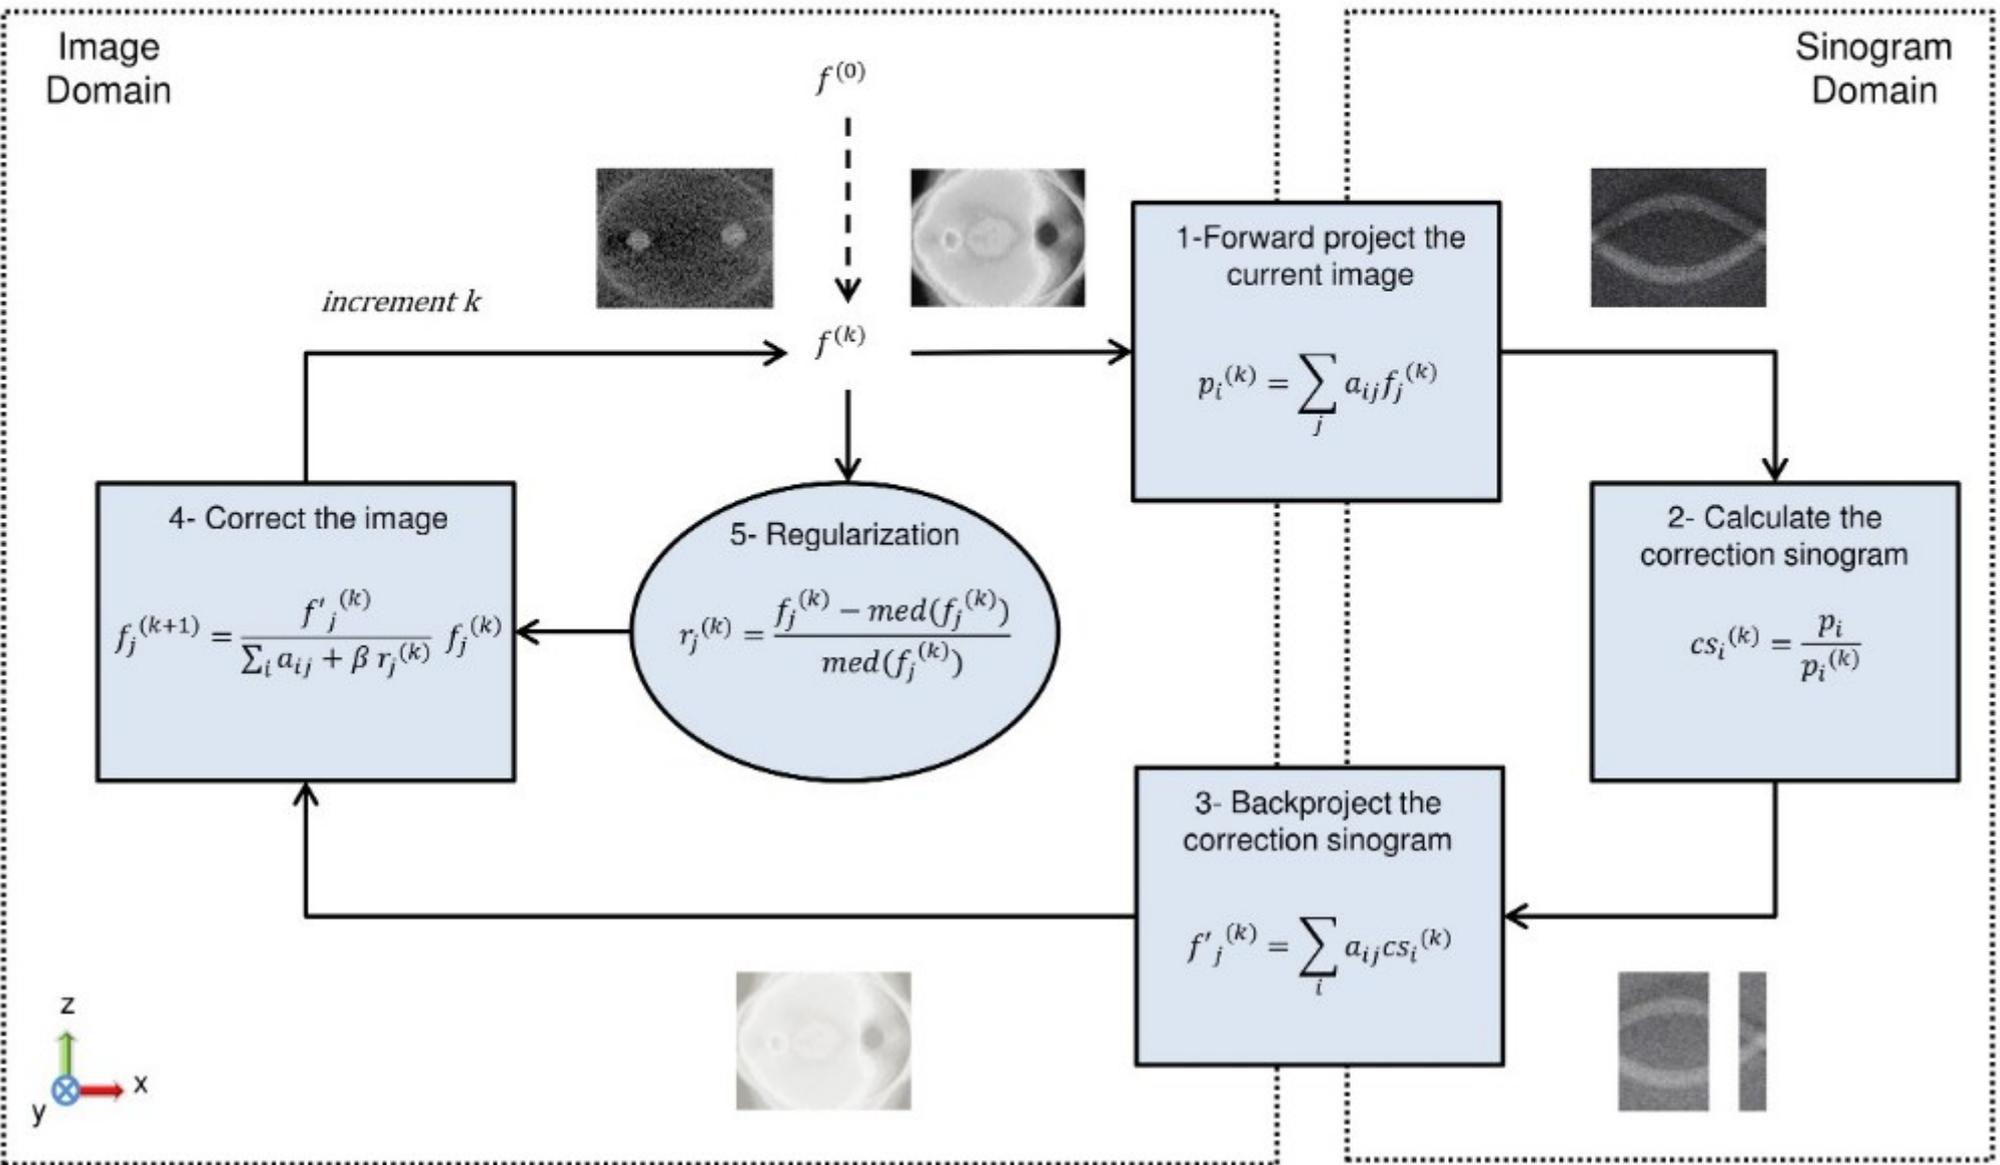

$p(f)$ is prior probability

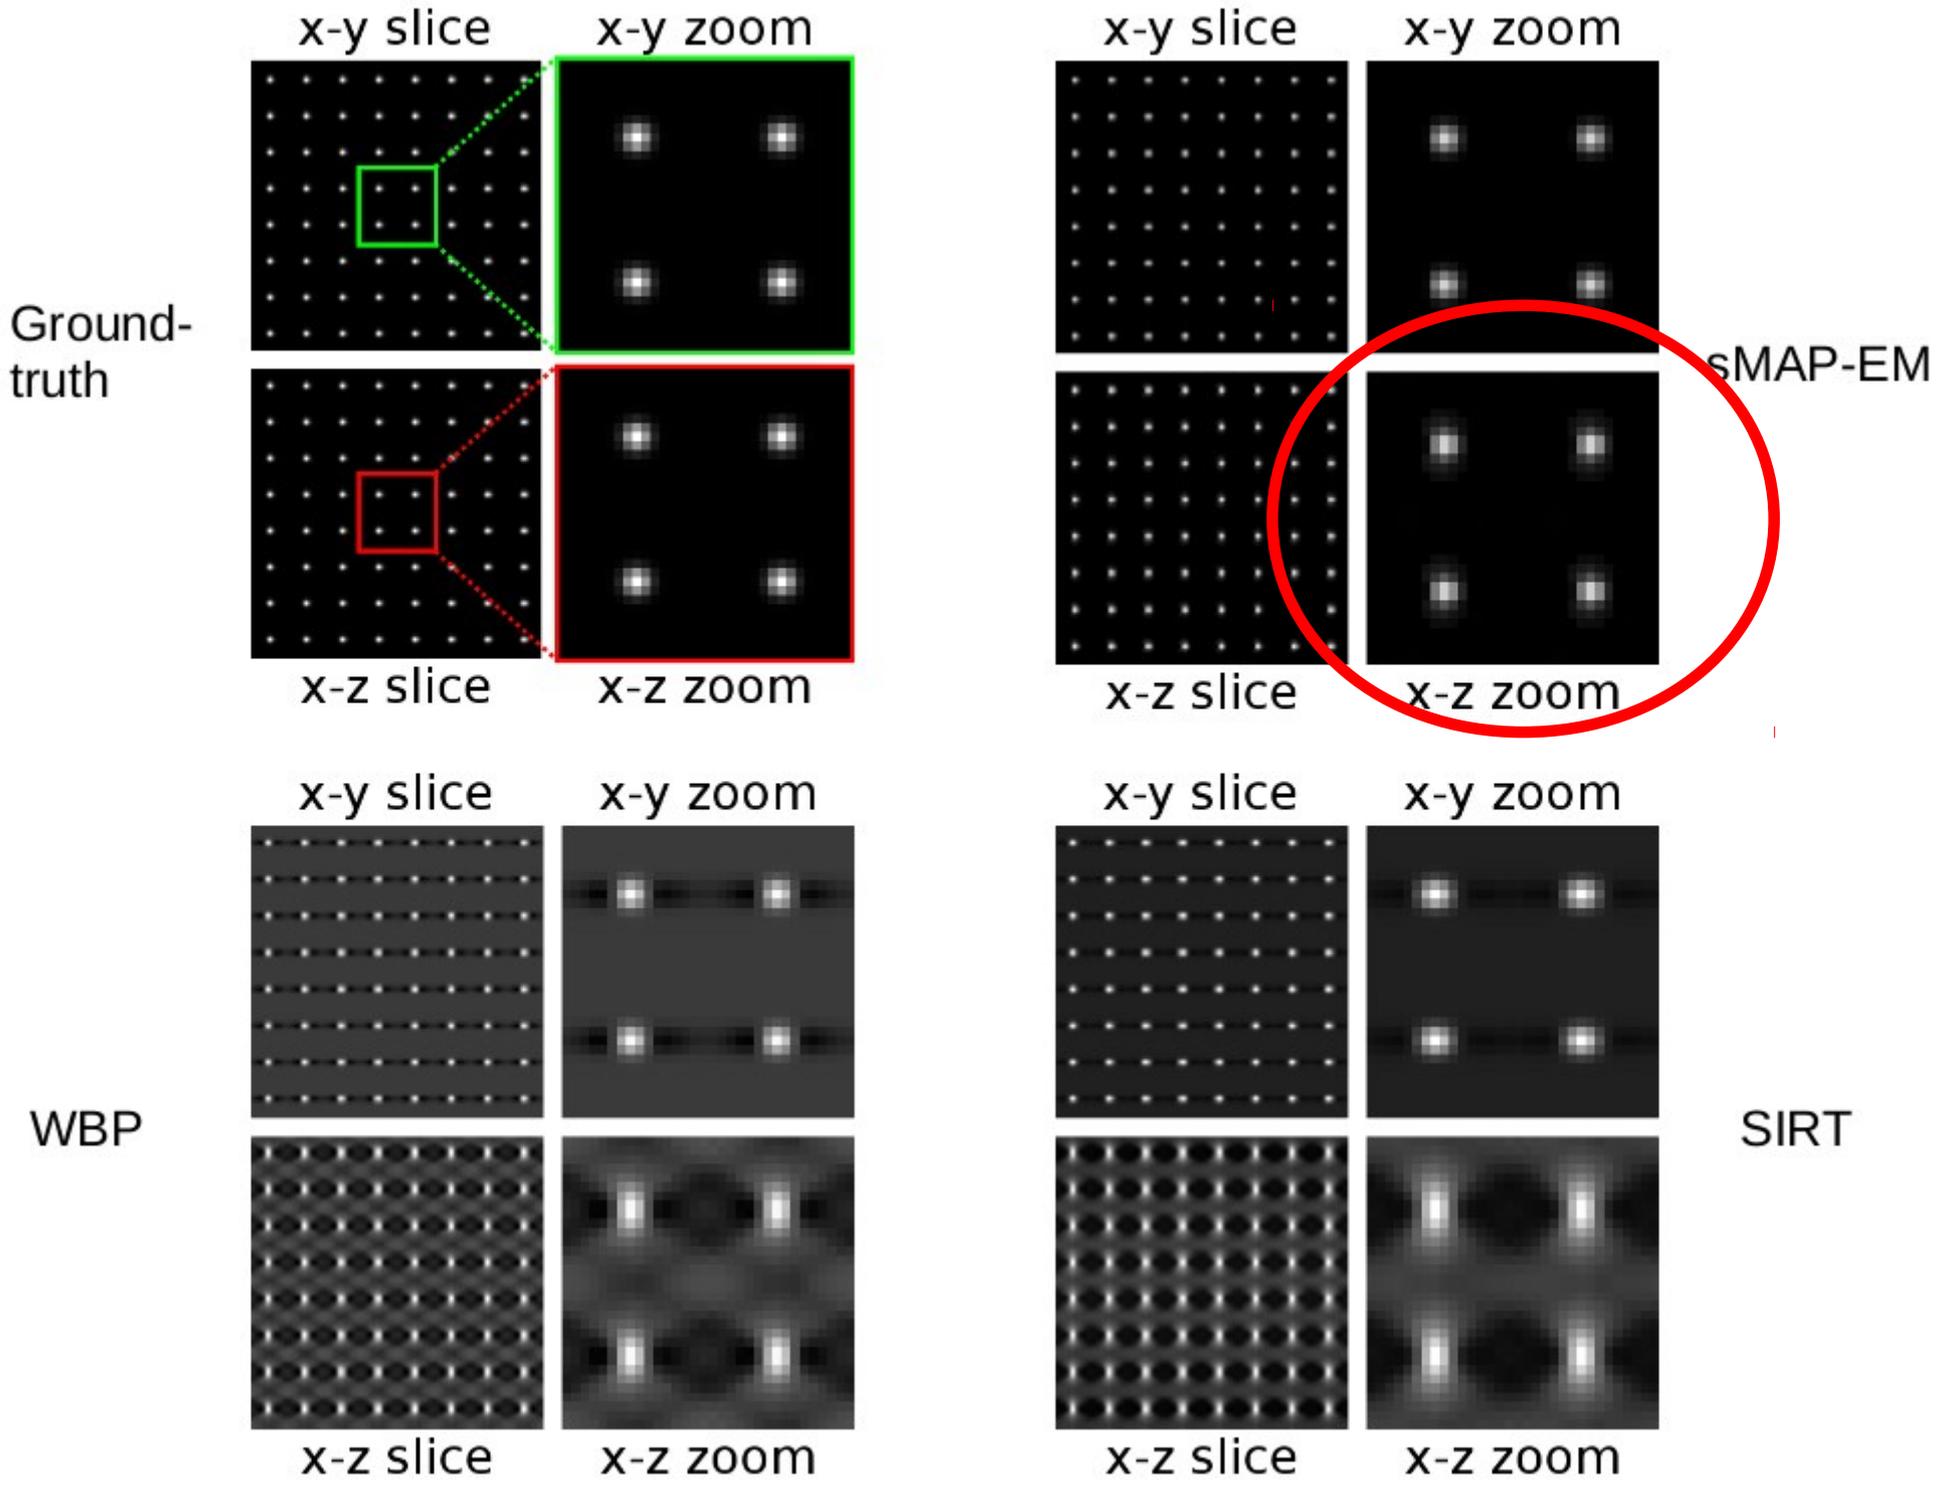

$p(g)$ is marginal probability

Chemically Activatable Nanocapsid Functionalized For Cancer Targeting

Tech ID: 24218 / UC Case 2014-684-0

Abstract

Researchers from the University of California, Davis have engineered a HEV-based nanoparticle that selectively targets cancerous breast tissue. These multi-functional nanoparticles are conjugated to cancer ligands, which makes them highly specific for cancer cells while enabling the delivery of therapeutics to those cells. The HEV-based nanoparticles provide for a multifunctional platform capable of carrying simultaneously cell adhesion tags, biomarkers, imaging probes as well as DNA vaccine for image-guided drug delivery.

Full Description

Background

Nanocarriers have been constructed from biological and chemical substances such as albumin and solid metal-containing particles, respectively. Virus-like particles (VLPs) have been used as nanocarriers to display foreign epitopes and also deliver small molecules. Nanocarriers as drug delivery systems enable a sophisticated approach to combat many diseases, including cancer.

Novel therapy
